

# Control camera in a distance

## Objective:

- Control a camera in a distance, placed on a cable or on a rail

## Product:

- ARM-SE

## Application:

The ARM-SE modems were present in several cameras at Beijing and Vancouver Olympic Games. It is possible, at a distance, to take the control of the camera movements: direction, rotation and zoom.

## Configuration:

The protocol used in this kind of application is generally proprietary, so the modems must be configured in transparent mode, serial link, via its embedded web pages.
